INTRODUCCION

1) - PRINCIPALES CARACTERISTICAS DEL CLIMA DE BOGOTA

1) NOTAS BREVES

El Instituto Geográfico "Agustín Codazzi", hace entrega de esta edición de "Anales del Observatorio Meteorológico de Bogotá, 1.960" basado en observaciones efectuadas por el Instituto, adicionado con un suplemento climatológico, resultado de registros y observaciones del Observatorio Meteorológico Nacional en el período 1.931 - 1.960.

Se incluye, además, una bibliografía climatológica y meteorológica de Bogotá y la Sabana, a fin de facilitar consultas más completas sobre el clima correspondiente.

La relación de publicaciones que figura en la página 1 constituye el conjunto de los trabajos hechos por la Sección de Climatología a través de las distintas denominaciones que ha tenido.

Teniendo en cuenta la recomendación de la Organización Meteorológica Mundial (OMM) sobre normales, o sea los valores climatológicos medios, durante períodos continuos de 30 años así: Enero 1 de 1.901 a Diciembre 31 de 1.930; Enero 1 de 1.931 a Diciembre 31 de 1.960, etc., se han obtenido para Bogotá los valores normales de los principales elementos meteorológicos correspondientes a los períodos ya mencionados.

El análisis del material antes señalado, especialmente el examen de los gráficos, y el estudio de los trabajos realizados por eminentes investigadores del siglo pasado y del presente sobre el clima de Bogotá y la Sabana, citados en la Bibliografía, nos permiten hacer los siguientes comentarios de las condiciones meteorológicas generales.

2) LLUVIA

En el presente trabajo se considera como lluvia toda cantidad registrada igual o mayor a 0.1 mm.

En el período 1866 - 1900, se observa que;

El año de mayor precipitación fué 1879 con	1633.1
" " " menor " " 1895 " "	667.8
" mes " mayor " " marzo 1879	394.5
" " " menor " " junio 1897	0.0

En el período 1901 - 1930, se observa que;

El año de mayor precipitación fué 1910 con	1444.8
" " " menor " " 1929 "	690.5
" mes " mayor " " octubre 1908	267.8
" " " menor " " enero 1924	0.0

En el período 1931 - 1960, se observa que; (Ver gráficos M-35 y M-36)

El año de mayor precipitación fué 1950 con	1375.6 mm.
" " " menor " " 1941 "	552.7 "
El año con mayor número de días lluviosos 1956 con	231
" " " menor " " 1959 "	164
" mes más lluvioso fué noviembre 1935	318.3 mm.
" " menos lluvioso fué febrero 1939	1.7 "
" día más lluvioso fué noviembre 19 de 1.932	72.4 "
Lluvia media anual	940.9 "
Promedio de días lluviosos	192

Los promedios mensuales de lluvia en el período 1931 - 1960, fueron los siguientes:

	mm.	%		mm.	%
Octubre.....	144.4	15.35	Abril.....	99.5	10.58
Noviembre.....	136.3	14.70	Mayo	105.2	11.18

	mm.	%		mm.	%
Diciembre.....	85.0	9.03	Junio.....	57.4	6.10
Enero.....	51.3	5.45	Julio.....	46.8	4.97
Febrero.....	50.4	5.36	Agosto.....	41.2	4.38
Marzo.....	69.1	7.24	Septiembre....	52.3	5.56
Sub-totales....	538.5	57.23		402.4	42.77
MEDIA ANUAL (Totales)		940.9 mm. 100 %			

De las combinaciones mensuales continuas posibles, del mismo periodo, resulta más lluvioso el semestre: octubre, noviembre, diciembre, enero, febrero y marzo; que el semestre: abril, mayo, junio, julio, agosto y septiembre.

Según las cantidades medias mensuales de lluvia aparece octubre como el mes más lluvioso y agosto como el menos lluvioso; en orden decreciente se tiene: octubre, noviembre, mayo, abril, diciembre, marzo, junio, septiembre, enero, febrero, julio y agosto.

Pueden considerarse como meses de transición los de marzo y diciembre, en atención a que las lluvias en la segunda quincena de marzo son muy superiores a las de la primera y, en diciembre, la primera quincena es más lluviosa que la segunda.

En el periodo 1931 - 1960 (Véase gráfico M-36) se distinguen claramente dos periodos de lluvias intercalados con otros dos períodos de reducida precipitación, distribuidos así:

- 1er. Período de escasas lluvias Enero y Febrero
- 2o. " lluvioso Marzo, Abril y Mayo
- 3er. " de escasas lluvias Junio, Julio, Agosto y Septiembre
- 4o. " lluvioso Octubre, Noviembre y Diciembre.

Del gráfico M-37 se establece que es mayor la lluvia diurna que la nocturna; la diurna representa el 64.1 % y la nocturna el 35.9 %.

Dividiendo el día en cuatro lapsos de 6 horas cada uno, resulta más lluvioso el de las 12 a las 18 horas — (12 m. a 6 p.m.) con 55.32 % y menos lluvioso el comprendido entre las 6 y las 12 horas con un 8.78 %.

Las horas de mayor lluvia media son las de:

15 a 16 (3 a 4 p.m.) con el 13.25 %
14 a 15 (2 a 3 p.m.) " " 12.53 "

Las horas de menor lluvia media son las de:

8 a 9 horas con el 0.95 %
9 a 10 " " 1.01 "

Evaporación.— En el periodo 1956/60, la evaporación media anual fué de 476.6 mms.; la media mensual más alta con 47.4 mms. corresponde a septiembre y la más baja de 32.9 mms. a noviembre. Es importante advertir que para la determinación de estos valores, se empleó un evaporígrafo de balanza, marca "Fuess", instalado en un abrigo meteorológico.

Evapotranspiración.— Considerando que no se dispone de datos experimentales de evapotranspiración en este Observatorio y que según nuestra información no existen para la Sabana de Bogotá, se ha optado por calcularlos según las fórmulas de L. R. Holdridge y C. W. Thornthwaite; ambas basadas en los valores medios de temperaturas.

Los valores calculados por ambas fórmulas para los años 1941 y 1956/60 aparecen en la página 196 y en los gráficos M-45 y M-46.

En atención a que varios autores consideran que muy probablemente la evaporación resulte igual a la transpiración, para el análisis subsiguiente nos vamos a decidir por los datos obtenidos según el sistema de Holdridge, que en nuestro concepto ofrecen un mayor margen de seguridad.

A Así por ejemplo, si observa el gráfico M-45 se puede deducir rápidamente:

Que para el año 1941 es notorio el déficit de agua (parte sombreada), en cambio, no sucede lo mismo para - los años 1956 a 1957.

Una situación similar puede apreciarse en el gráfico M-46, donde se distingue un déficit crítico de humedad (parte sombreada), que se prolonga desde enero hasta setiembre de 1958, no sucediendo lo mismo para - los años 1959 y 1960 donde el aparente déficit de agua no es tan crítico como para el año 1958.

Por otra parte debe tenerse en cuenta que si efectúa la siembra, en época oportuna, de algunos cultivos de período vegetativo de 150 días, aproximadamente, el déficit de agua no sería tan crítico como sucedería - con cultivos permanentes como los pastos, o con aquellos que se siembran en cualquier época como las hortalizas.

3) TEMPERATURA

En el período 1931 - 1960 se observa que: (Ver gráfico M-40)

	°C
La temperatura máxima (varios días), fué de	25.0
La temperatura mínima (febrero 12 de 1948)	-5.2
La temperatura media anual es de	14.3 (1)
La temperatura media anual horaria (1956 a 1960),	13.2
La temperatura media anual (1956 a 1960) es de ...	13.7 (1)

Debemos anotar que en cuanto a temperaturas medias anuales del Observatorio Meteorológico obtenidas según la cita (1), se aprecia una muy pequeña diferencia entre los valores registrados en San Bartolomé y los de la Ciudad Universitaria, siendo mayores ligeramente los primeros, debido probablemente a que allí existen más construcciones y combustiones, algo similar puede decirse para los dos sitios de la Ciudad Universitaria, donde funcionó hasta 1958 y donde funciona actualmente el Observatorio; en este último lugar parece - notarse una ligera tendencia a disminuir, probablemente debido a la mejor disposición de las cassetas a un ambiente natural.

Por otra parte existe una pequeña diferencia entre la media de temperatura obtenida según el procedimiento indicado en la cita (1) y la misma media anual horaria, calculada según las lecturas directas (horas hábiles de trabajo) y evaluación horaria de las gráficas del termógrafo, para el período 1956/60 la media hora resulta 0.5°C por debajo de la obtenida por el sistema señalado en la cita (1) (véase gráfico M-40).

Otro aspecto que debe considerarse, es la poca diferencia entre las medias mensuales, es decir, entre el - mes más caliente y el mes más frío, pudiendo fijarse como límite anual para la citada diferencia el de 2°C.

En cambio las temperaturas mínimas, especialmente en los meses de diciembre, enero y febrero muestran bruscos descensos, inclusive por debajo de 0°C aun cuando esto es apenas momentáneo, ya que su duración no sobrepasa generalmente los 15 minutos.

Heladas y Escarchas.- Fenómenos de efectos bien conocidos, por el desastre que a veces suelen ocasionar so- bre la vegetación.

Pijando como base temperaturas mínimas inferiores a 3°C, en el cuadro de la página 197 de frecuencias de - temperaturas mínimas (1931 - 1960) se nota rápidamente que los meses de mayor ocurrencia son enero (30,60%) febrero (21,88%), y diciembre (17,19%), quedando un (21,33%) para los 7 meses restantes.

(1) Obtenida así:

$$\text{Temperatura media diaria (tmd)} = \frac{\text{Máxima} + \text{Mínima}}{2}$$

$$\text{Temperatura media mensual (tmm)} = \frac{\sum \text{tmd}}{\text{No. de días del mes}}$$

$$\text{Temperatura media anual (tma)} = \frac{\sum \text{tmm}}{12}$$

Heliofania Efectiva.- 1941 - 1960

Radiación.- 1956 - 1960

Los meses de mayor heliofania (brillo solar) son en su orden enero, febrero y diciembre; los de menor abril, mayo y octubre; los de mayor radiación solar enero, febrero y marzo y los de menor-octubre, abril y mayo (véanse, gráfico M-42 y página 196); las horas de mayor heliofania: 9 a 10 y 8 a 9 y las de menor 6 a 7 y 17 a 18. El mes de máximo brillo solar Enero 1957, el mes de menor brillo solar Abril-1946.

4) VIENTO

Si observa el gráfico M-44 se aprecia a simple vista una relación muy estrecha entre la cantidad media de lluvia y la dirección general de los vientos. Así se nota, por ejemplo, que para el semestre más lluvioso - octubre - marzo, la dirección dominante del viento es la de NWW. En cambio, para el semestre menos lluvioso abril - septiembre, se tiene un viento dominante de SSE.

5) OTRAS FENÓMENOS

Granizo.- Las granizadas en Bogotá, son de relativa poca frecuencia y variada intensidad. Suelen presentarse generalmente en los meses de enero, febrero, marzo, octubre, noviembre y diciembre.

Arco Iris.- Este fenómeno es de frecuente ocurrencia, al aparecer el sol en la parte final de las precipitaciones o durante la caída de tenues lloviznas. La aparición del arco iris, en Bogotá, es muy frecuente durante los meses de junio, julio y agosto por las continuas lloviznas propias de esos meses.

6) EPOCAS DE SIEMBRA PARA LA SABANA DE BOGOTÁ

La siembra para la cosecha principal en la Sabana de Bogotá, se efectúa generalmente en marzo y se espera - la recolección en julio; para la cosecha secundaria la siembra se efectúa generalmente en agosto - setiembre y se recoge en diciembre o enero.

Para el desarrollo de los cultivos de dos cosechas anuales (trigo, cebada, papa, etc.) consideraremos dos factores del clima como los más importantes en su orden: temperaturas y lluvias.

En cuanto al primero analizaremos principalmente la temperatura mínima por sus efectos sobre la vegetación - (escarcha, helada) y referente al segundo, las lluvias, por su cantidad y distribución.

Aquí se podría preguntar por qué razón la cosecha principal no es la que corresponde a la siembra que se realiza en setiembre, siendo que la cantidad de lluvia media para el semestre octubre a marzo representa el 57% lo cual ofrece un mayor margen de humedad para el desarrollo normal del cultivo y nosotros responderíamos que la razón principal desde el punto de vista de factores climáticos la constituyen esencialmente las heladas y escarchas de enero y febrero que son las de mayor intensidad en la Sabana.

B) - ANALES DEL OBSERVATORIO METEOROLÓGICO 1960

1) UBICACION DEL OBSERVATORIO

El Observatorio Meteorológico hace parte de las instalaciones del Instituto Geográfico "Agustín Codazzi". Este se encuentra ubicado en el extremo NE de la Ciudad Universitaria, en zona aledaña a las edificaciones de la Universidad Nacional de Colombia.

La edificación consta de diez plantas en su parte central y, por su mayor altura entre las circunvecinas, - la azotea superior tiene un horizonte libre en todas direcciones.

Una cadena de montañas que bordea al Distrito Especial de Bogotá, se extiende desde el SUR hacia el NE, donde la menor distancia es aproximadamente de dos y medio kilómetros en línea recta al NORTE; dentro de esta - cadena que es un ramal de la cordillera Oriental se encuentran de SUR a NORTE las siguientes elevaciones:

Páramo de Cruz Verde con 3.663 mts. s.n.m.

Cerro de Guadalupe " 3.250 " " " y 650 metros sobre el nivel de Bogotá

Cerro de Monserrate con 3.160 mts. s.n.m. y 560 metros sobre el nivel de Bogotá
Cerro Piedras " 3.333 " " "

Al OESTE se extiende la Sabana de Bogotá.

2) CONSTANTES DEL OBSERVATORIO

Las coordenadas geográficas son:

Latitud $4^{\circ} 38' 29''$ Norte
Longitud $74^{\circ} 05' 00''$ W de Greenwich
Longitud $4h\ 56m\ 20s$ W de Greenwich
Altitud 2.556 metros.

La aceleración de la gravedad 977.4051 cm. seg.⁻²

La corrección por gravedad del Barómetro ... -1.5 mm.s.

3) INSTRUMENTOS DEL OBSERVATORIO

El instrumental del Observatorio se encuentra instalado de la manera siguiente: al costado sur del edificio del Instituto, a una distancia aproximada de 75 mts., en un lote de terreno de 20 x 20 mts., cercado con - malla metálica, se encuentran cuatro cajas de madera giratorias, dos Pluviógrafos, un Pluviómetro y un Rastrillo Nefoscópico.

En uno de los sótanos del edificio están colocados los instrumentos barométricos, sobre la azotea de la no - venia planta están los aparatos de radiación y sobre la azotea del bloque central - planta décima, están - emplazados los registradores de viento.

EL EQUIPO EN FUNCIONAMIENTO DEL OBSERVATORIO, CONSTA DE LOS SIGUIENTES APARATOS:

VIENTO

	Altura mts.
1 - Anemómetro eléctrico "Richard" con nueve plumas-dirección y recorrido en km.s.- registro semanal	38
1 - Anemógrafo eléctrico "Richard" para velocidad del viento, registro diario	38
1 - Anemógrafo "Instrument Corporation"	38
1 - Velsta mecánica "Puess", con dos plumas, registro diario	38
1 - Teodolito "Askania" para sondeos, de registro automático.	
1 - Teodolito "Puess" para sondeos, lectura directa.	

PRESIÓN

1 - Barómetro "Puess", sótano	0.0
2 - Barógrafos de gravedad, compensados, "Richard" de registro semanal	1.0
1 - Microbarómetro "Askania".	

TEMPERATURA

2 - Termómetros de máxima (en caja)	1.8
2 - Termómetros de mínima (en caja)	1.7
1 - Termógrafo "Richard", de registro semanal	1.2
1 - Termógrafo "Puess", de registro semanal	1.2
1 - Termógrafo "Instrument Corporation", de registro diario	1.2

HUMEDAD

1 - Higrógrafo "Instrument Corporation", de registro diario	1.3
2 - Higrógrafos "Puess", de registro semanal	1.3

2 - Psicrómetros "Puess" 1.4
 Las lecturas de las temperaturas máximas y mínimas se efectúan a las 17 y 07 horas, - respectivamente.

E V A P O R A C I O N

1 - Evaporígrafo "Puess" de balanza, registro diario, en abrigo 1.3

L L U V I A - S O L

1 - Pluviómetro "Puess" con probeta	1.5
2 - Pluviógrafos "Puess", de registro diario	1.5
2 - Actinógrafos "Puess", de registro semanal	26.0
1 - Heliógrafo "Puess", de registro diario	26.0
1 - Heliógrafo "Siap", de registro diario	26.0

4) ABREVIATURAS Y SIGNOS

Como abreviaturas y signos convencionales se han empleado los que figuran a continuación:

Ci	Cirrus
Cc	Cirrocumulus
Cs	Cirrostratus
Ac	Altocumulus
Ac len	Altocumulus lenticulares
As	Altostatus
Ns	Nimbostratus
Sc	Stratocumulus
St	Stratus
St fra	Stratus Fractus
Cu hum	Cúmulus humilis
Cu gen	Cúmulus genitus
Ci con	Cúmulus congestus
Cb inc	Cúmulonimbus incus
Cb cap	Cúmulonimbus capillatus
Pra cu	Fractocúmulus
Pan	Pannus
) (.....	Precipitación distante (más de 5 kms. de la estación)
()	Precipitación cercana
◆	Precipitación a la vista sin llegar al suelo
●	Lluvia
●'	Lluvia inapreciable
●··	Llovizna
△	Granizo
▽	Chubasco de lluvia
○	Visibilidad excepcional (más de 50 kms)

⊖	Corona Lunar
⊖	Halo Lunar
N.F.	No funcionó el registrador
I.M.	Intensidad media

5) COMENTARIO AL TIEMPO DE BOGOTÁ - 1960

Las observaciones meteorológicas se iniciaron en el Instituto Geográfico el dia 10. de Septiembre de 1958 y son éstas, continuación de las que se verificaron en el Observatorio Meteorológico Nacional -Ciudad Universitaria- en el periodo: Marzo 10. de 1941 - Agosto 31 de 1958.

En la presente entrega se incluyen nuevos datos: temperatura del punto de rocío, radiación solar, evapotranspiración e insolación horaria. También se insertan resúmenes y gráficos de los principales elementos meteorológicos.

El año de 1960 se caracterizó, de manera general, por un tiempo más bien seco dentro de una normal ocurrencia de lluvias. En cambio, se registraron algunas modificaciones en la distribución mensual de las mismas - lluvias y otras muy notables en las intensidades máximas.

Comparando la distribución de las lluvias mensuales durante el año de 1960 con la normal de los últimos - treinta años pueden indicarse las siguientes modificaciones presentadas:

Meses muy inferiores a la normal:	Enero, Mayo, Junio y Noviembre
Meses inferiores a la normal:	Octubre
Meses normales:	Febrero, Marzo, Abril y Septiembre
Meses superiores a la normal:	Julio, Agosto y Diciembre.

Por la cantidad de lluvia, junio resultó el más seco y agosto el más lluvioso en los últimos 30 años.

Por otra parte, coincidiendo con el mes de agosto que se observa fue lluvioso, en todo el territorio nacional se presentaron grandes lluvias, especialmente alrededor del dia 13.

Merecen mencionarse las máximas intensidades, para períodos de 10 a 20 minutos, que se registraron en los meses de Julio y Agosto. De acuerdo con la siguiente relación de intensidades máximas aparecen las de estos meses como las más altas en los últimos treinta años; así se tiene:

MÁXIMA INTENSIDAD MM/H.

		10 min.	20 min.
1931 - 1959	Julio 26/47	24.0	21.9
	Agosto 10/35	45.0	34.5
1960	Julio 12	60.0	53.7
	Agosto 13	110.4	61.2

Con base en los valores de 1931/59 el aumento en mm. y su % correspondiente para 1960 es, respectivamente:

mm.	%	mm.	%
36.0	150	31.8	145
65.4	145	26.7	77

Esta intensidad máxima de 110.4 mm/h para el mes de Agosto, considerado como el más seco, sólo ha sido su-

perada por los meses caracterizadamente lluviosos como Abril, Mayo y Noviembre. Es igualmente notable que - en el mes de Octubre, el más lluvioso, no se alcance a registrar un valor tan alto como el de Agosto. Pues - pues, la lluvia del día 13 de Agosto de 1960, a través de los treinta años inmediatamente anteriores, de - una intensidad excepcional.

Los valores de intensidades máximas para 10 y 20 minutos en mm/h. que aparecen tabulados en el presente - trabajo fueron obtenidos así:

La máxima cantidad de lluvia registrada en 10 minutos fue multiplicada por 6 y

La máxima cantidad de lluvia registrada en 20 minutos fue multiplicada por 3.

TEMPERATURAS EXTREMAS.- Las temperaturas máximas, oscilaron entre 15.0 y 23.4 °C; la máxima alza del termómetro se efectuó el 9 de Marzo y fue de 23.4 °C; la temperatura máxima más baja en el año fue de 15.0 °C el día 6 de Agosto. El promedio anual de registros diarios de temperaturas máximas en 1960 fue de 19.7 °C.

Las temperaturas mínimas oscilaron entre 0.5 °C bajo cero y 11.3 °C; el mayor descenso de la temperatura se registró el 24 de Febrero y fue de 0.5 °C bajo cero. El registro más alto de temperatura mínima en el año - fue de 11.3 °C el día 2 de Diciembre. El promedio de valores diarios de temperaturas mínimas fue de 7.0 °C.

ESCARCHA Y HELADAS.- En 1960, se registraron y anotaron heladas en los días 23, 24, 25 y 29 de Febrero. Es presumible que hayan ocurrido otras heladas en Enero, Febrero y Diciembre en la Sabana, que no se percibieron en el Observatorio, pues en él la temperatura mínima es más moderada por su proximidad a edificios, etc. Posiblemente en varios de los días en que aparece el registro mínimo de temperaturas menor de 3.0 °C, haya ocurrido helada en zonas rurales cercanas a la ciudad.-

HELIOFAMIA EFECTIVA.- El número de horas de sol registradas en Bogotá en 1960, fue de 1.649.9. El promedio diario en horas y décimos de hora de sol para cada mes fue el siguiente:

MESSES	PROMEDIO DIARIO
	HORAS Y DECIMAS
Enero	5.7
Febrero	5.6
Marzo	5.7
Abril	3.6
Mayo	3.5
Junio	3.9
Julio	3.9
Agosto	4.4
Septiembre	4.7
Octubre	4.0
Noviembre	4.1
Diciembre	6.2

En promedio, a cada una de las 12 horas posibles de sol en Bogotá (6 a 18 horas) le corresponde el siguiente valor:

HORAS	CANTIDAD EN MINUTOS
6-7	5
7-8	23
8-9	29
9-10	30
10-11	28
11-12	26

143 mañana; media $\frac{143}{6} = 24$ minutos.

HORAS	CANTIDAD EN MINUTOS
12-13	27
13-14	26
14-15	25
15-16	25
16-17	20
17-18	9

$$132 \text{ tarde; media } \frac{132}{6} = 22 \text{ minutos}$$

Promedio diario 4 horas 35 minutos

La hora de mayor cantidad de sol de 9 a 10 horas

La hora de menor cantidad de sol de 6 a 7 horas

El mes de mayor cantidad de horas de sol, Diciembre; el de menor cantidad de horas de sol, Abril.

RADIACION

Mes de mayor radiación Enero, promedio diario 421
 " " menor " Abril, " " 360

Día con menor radiación Abril 18-148
 " " mayor " Julio 18-642

VIENTOS.- Con relativa poca variación los vientos predominantes fueron SE - SSE y ESE, en los períodos de verano; y W - WWW - WSW y SW en los períodos de invierno.

La continuidad de los vientos es mayor en los meses de menor precipitación; su máxima actividad e intensidad se presenta en los meses de Junio, Julio y Agosto, casi invariablemente del sur, sureste y este, arrastrando a su paso por sobre los páramos adyacentes a Bogotá, situados en esa dirección, la nubosidad allí estacionada, produciendo las incesantes lloviznas características en esos meses en la capital.

GUIA DE PUBLICACIONES DE LA
SECCION DE CLIMATOLOGIA

ANUARIO METEOROLÓGICO

(Información general del país), años 1931 a 1954.

Para la distribución al público solamente se dispone de la serie correspondiente a los años 1948/1954. (1)

ANALES DEL OBSERVATORIO METEOROLÓGICO NACIONAL

(Información de Bogotá), años 1923 a 1960.

De esta serie se hallan totalmente agotadas las entregas correspondientes a los años - 1923 a 1936, 1939 y 1940. (1)

REGIMEN DE LLUVIAS EN LA SABANA DE BOGOTÁ

Partes 1a., 2a. y 3a., Ciudad Universitaria, 1941 - 1955; Instituto Geofísico de los - Andes Colombianos, 1942 - 1955; Colegio de San Bartolomé, 1923 - 1941, respectivamente.

De esta serie se hallan agotadas las partes 1a. y 2a. (1)

REGIMEN DE LLUVIAS EN BOGOTÁ

1866 - 1958.

Entrega totalmente agotada. (1)

NOTA: La distribución al público de las citadas publicaciones, las hace directamente la Sección de Archivo-técnico del Instituto Geográfico "Agustín Codazzi".

Los canjes se atienden en el Departamento de Investigaciones del Instituto Geográfico.

(1) En la Sección y en la Biblioteca del Instituto Geográfico, se dispone de la colección completa.
